

Production Services

GasPro has been successfully serving all business segments in the Gas industry since the early 90's by providing a truly seamless, user friendly solution from deal capture through financial statements. GasPro also provides the unique functionality required to succeed in the Producer Services Market.

CDP Allocations

GasPro has the ability to associate wells with a Central Delivery Point (CDP). Scheduled volumes entered at these wellhead locations are automatically transferred to the CDP for pipeline scheduling. Actual volumes at the CDP are then automatically allocated back to the wellhead suppliers based on the percentage of scheduled volumes.

Processing Plants

The ability to schedule volumes through processing plants can be done on a multiple wellhead basis. The system automatically calculates the residue volumes, taking into account: bypass, transport fuel, PTR, and plant fuel volumes. This residue gas can now be scheduled to storage or to its ultimate use.

Plant Actuals

The GasPro Plant Actuals module facilitates the true-up of the scheduled volumes and PTR estimates to the plant statement information. The plant liquid units and the associated revenues are then accounted for appropriately depending on the recipient of the plant proceeds.

Netbacks

The Netback functionality within GasPro gives the user the ability to calculate the purchase price of the supply gas based on its ultimate sales price, less any basis costs, without having to re-enter any additional deal information. This netback feature also has the ability to pre-assign supplies to designated deliveries.

Taxes / Fees

GasPro's Tax/Fee functionality allows for the entry and the tracking of the simplest to most complex tax or fee calculation. This functionality allows the tax or fee to be associated with a specific counter party, location, or contract. Whether they are a flat rate, percentage of volume, or on an ad valorem basis, GasPro can do it all.

SCADA / Interfaces

GasPro has the ability to interface with SCADA and other proprietary interfaces that allow the flow of information directly into GasPro, eliminating the need to enter this data manually.
